PULSEBAND

Find your friend.
Stay in the moment.

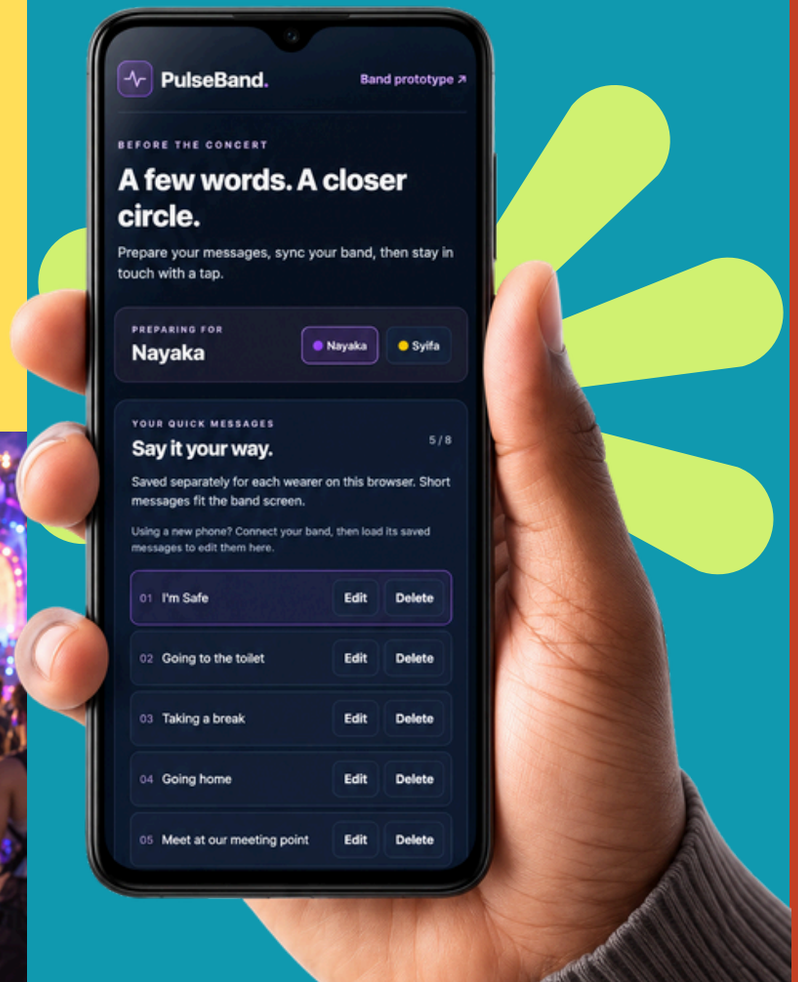

A wearable communication and direction system designed to help friendship groups reconnect and support one another at crowded music festivals

THE PROBLEM

When the crowd separates you.

At busy festivals, loud music, congested networks and constantly moving crowds can make phone communication unreliable. A delayed message may describe where someone was - not where they are now.

RESEARCH

What we learned from festival attendees

Interview Quote

"The loud music made phone calls almost impossible."

"A message saying where someone was standing was sometimes no longer useful by the time it arrived because the crowd had shifted."

"It was stressful because the performance had already started, and we were missing part of it while trying to find them."

Key Research Insights

Concert attendees do not necessarily need more communication. They need lightweight ways to maintain group awareness, coordinate changing plans and preserve meaningful experiences without repeatedly diverting attention from the live performance.

Common communication methods may become unreliable because of:

- Loud music that makes phone calls difficult
- Crowded environments with limited visibility
- Weak or congested mobile reception
- Delayed messages and outdated locations
- Low phone battery
- Safety concerns when repeatedly taking out a phone
- Friends choosing different activities or stages

MEET PULSEBAND

Premade Messages

Send useful updates without typing.

Direction Guidance

Follow an arrow and approximate distance to a selected friend.

SOS Support

Deliberately activate an alert for trusted group members.

Our research suggested that festival groups need more than continuous location tracking. They need a quick way to communicate their intention, identify a direction and ask trusted friends for support.

This led us to design **PulseBand**.

WE CREATE THE MOMENTS, YOU GET THE IMPACT!

WHAT MAKES IT DIFFERENT?

1. **Designed specifically for crowded festivals**
2. **No keyboard or complicated map**
3. **Temporary sharing with trusted friends**
4. **Simple interface requiring minimal attention**
